DETAILED ACTION

Allowable Subject Matter

1. The following is an examiner's statement of reasons for allowance:

The prior art of the record fails to teach or disclose alone or in combination: A drive circuit for a micromechanical resonator, which has at least one pulse modulator for conversion of a complex input signal to a pulsed signal, and which has: a quantization stage, which quantizes at least one of the real part and imaginary part of the control signal has been up-mixed by ω_0 and thus produces the pulsed signal, with the pulsed signal which is produced by the at least one pulse modulator being used for electrostatic oscillation stimulation of a resonator, and the pulse modulator has an adder which add the first result signal from the first multiplier and the second result signal from the second multiplier to form a sum signal in order to determine the real part of the up – mixed control signal, as recited by claim 32 and in combination with other elements of the claim.

Claims 32-38, 41, 43-46 are allowed over prior art.

The prior art of the record fails to teach or suggest alone or in combination: A method for pulse modulation of a complex input signal, characterized by the following steps: Quantization of at least one of the real part and imaginary part of the control signal, up-mixed by ω_0 , in order to produce a pulsed signal, with the pulsed signal being used for electrostatic oscillation stimulation of a micromechanical resonator, as recited in claim 53 and in combination with other steps of the claim.

Claims 53-55, 58-61 are allowed over prior art.

The prior art of the record fails to teach or suggest alone or in combination: A rotation rate sensor of the type that comprises a drive circuit and a micromechanical resonator, wherein said drive circuit includes at least one pulse modulator for conversion of a complex input signal to a pulsed signal for application to said resonator, said drive circuit further including: a quantization stage, which quantizes at least one of the real part and imaginary part of the control signal which has been up-mixed by ω_0 and thus produces the pulsed signal, with the pulsed signal which is produced by the at least one pulse modulator and which is used for electrostatic oscillation stimulation of the micromechanical resonator, as recited in claim 62 and in combination with other elements of the claim.

Claim 62 is allowed over prior art.

The prior art of the record fails to teach or suggest alone or in combination: A method for operating a rotation rate sensor of the type which a micromechanical resonator is driven using pulse modulation of a complex input signal, characterized by the following steps: quantization of at least one of the real part and imaginary part of the control signal, up-mixed by ω_0 , in order to produce a pulsed signal, and using the pulsed signal for electrostatic oscillation stimulation of the micromechanical resonator, as recited by claim 63 and in combination with other steps of the claim.

Claim 63 is allowed over prior art.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
